

Local RMSE falls across most of the weighted India footprint

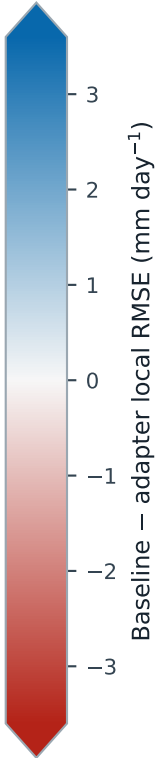

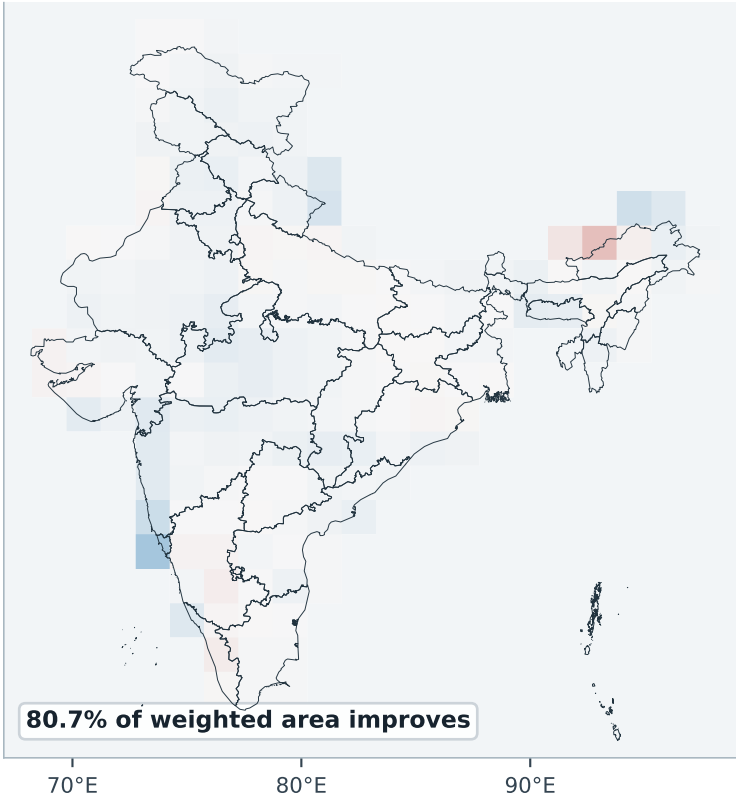

DEVELOPMENT AUDIT

Native 1.5° evaluation cells · positive values mean lower adapter RMSE · no interpolation

a Adapter vs Raw FuXi

b Adapter vs log-bias

c Spatial coverage of improvement by lead

Local RMSE = $\sqrt{\text{mean}(\text{error}^2)}$ at each cell over the stated starts/leads. Area fractions use static cell-area $\times$ IMD-support weights; fractional weekly coverage was not saved (0.0049% pooled-weight difference). Descriptive; no pixel-wise significance claim.
