

FuXi retains the JJAS advantage with system-specific climatologies

31 paired starts across 2023–2024 • same 1.5° all-season India support • arithmetic mean of per-initialization ACC

Higher ACC = better placement of the observed rainfall-anomaly pattern

FuXi forecast anomaly: native 2002–2021 reforecast climatology. ERPAS: provider 20-source climatology. IMD truth: IMD 1991–2020 climatology. Shading is the interquartile range across starts (descriptive, not a confidence interval).
